

# Advances in epidemic forecasting & implications for vaccination

Michael A. Johansson

Epidemic Prediction Initiative

Division of Vector-Borne Diseases, San Juan, Puerto Rico

*Fondation Mérieux*

*December 6, 2017*

“All decisions are made on the basis of models. Most models are in our heads. Mental models are not true and accurate images of our surroundings, but are only sets of assumptions and observations gained from experiences ... [Quantitative] models can compensate for weaknesses in mental models.”

- *Jay Forrester*

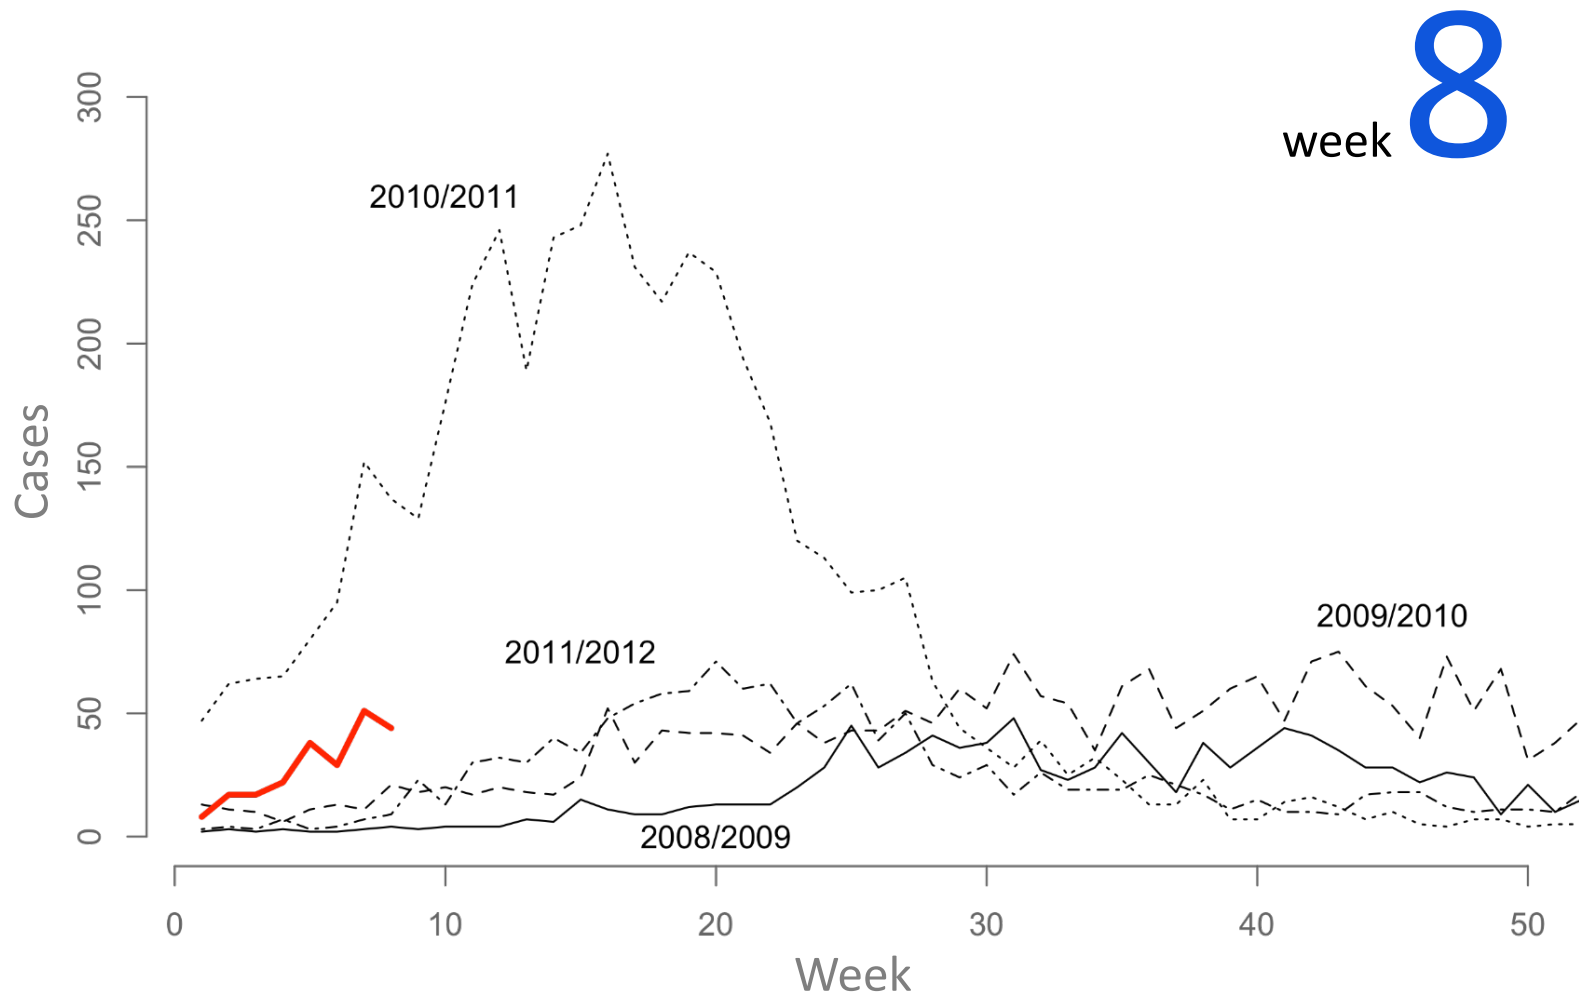

# Seasonal diseases

## Prioritization, timing, and scale of interventions

week **16**

week **24**

week **32**

week **40**

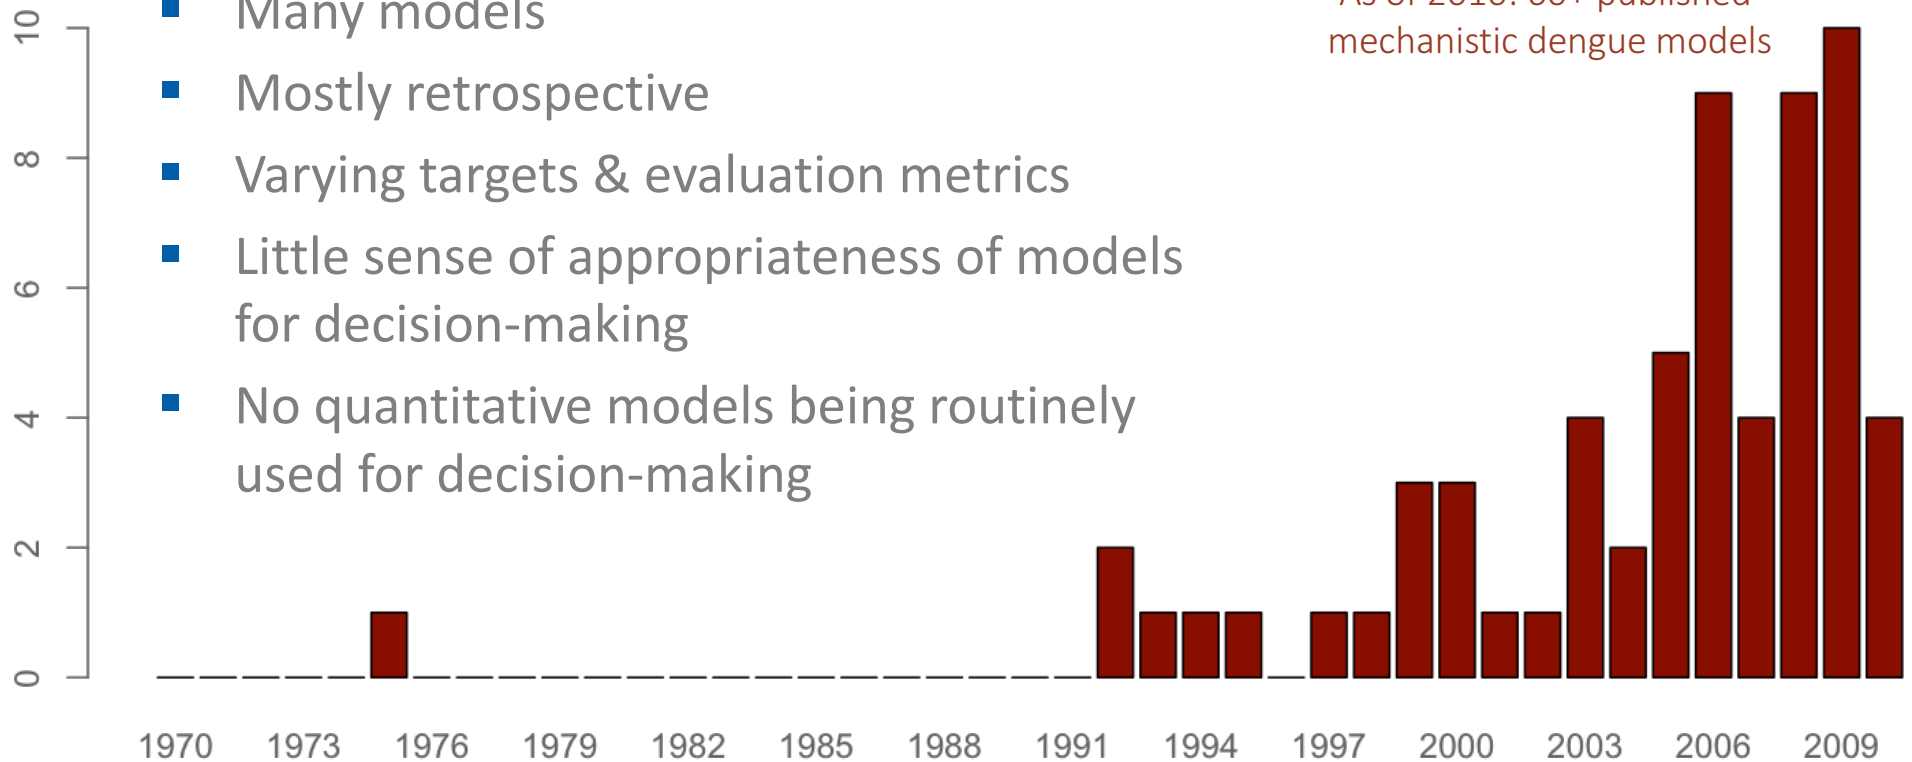

week **48**

# The state of dengue & influenza forecasting

- Many models
- Mostly retrospective
- Varying targets & evaluation metrics
- Little sense of appropriateness of models for decision-making
- No quantitative models being routinely used for decision-making

As of 2010: 60+ published mechanistic dengue models

# CDC Epidemic Prediction Initiative

- Started in 2014
- Objectives:
  - Connect forecasting research to decision making needs
  - Facilitate forecasting research
  - Evaluate forecast skill
  - Operationalize forecasting
- Contributors: Matthew Biggerstaff, Craig McGowan, Juan Sanchez Montalvo, Luis Mier-y-Teran, participants and collaborating organizations
- Funding: CDC Office of Public Health Preparedness & Response

# Open collaborative forecasting projects

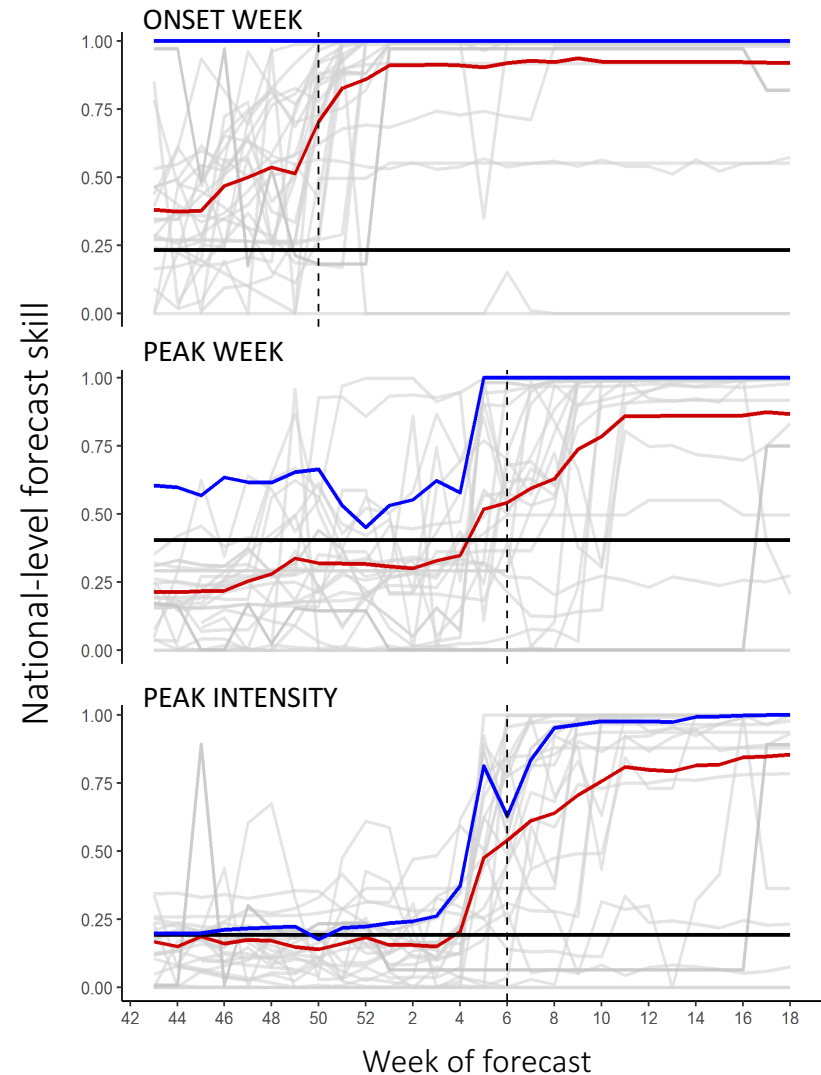

- Influenza (2013-present, CDC)
  - Real-time forecasting of ILINet (national, regional, state) and hospitalizations
  - Growing network of public health, academics, and private companies
- Dengue (2015, US Gov PPFST\* Working Group)
  - Retrospective forecasts for 8 dengue seasons in Puerto Rico & Peru
  - 16 participating teams

Flu forecasting participation

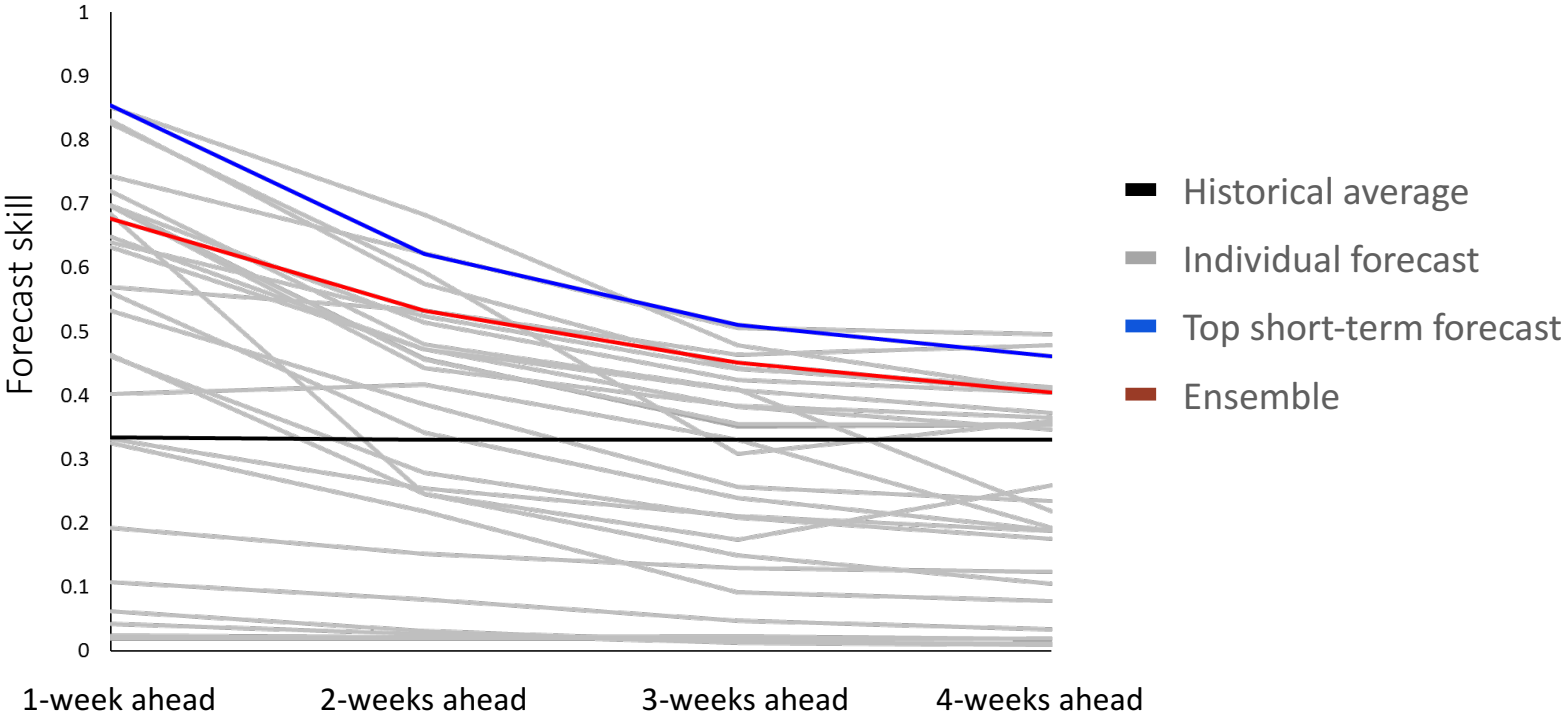

# US seasonal influenza forecasts 2016/17

- Individual forecasts often outperform the historical average
- Ensemble forecasts provide consistent improved performance across locations and time

# Short-term forecasts

# Forecast assessment

- 100,000+ forecasts have been quantitatively evaluated:
  - 2 pathogens
  - 13 locations
  - 7 seasons
- The importance of data and model types remains unclear.
- Early season forecasting remains challenge.
- **Current ensemble forecasts consistently outperform historical expectations.**
- New models, including improved ensembles, are being developed and tested all the time.

## Importance to vaccination

- Can real-time disease forecasts drive vaccine use?
- When should the most resources be directed to vaccination versus treatment?
- Is there time to develop a different vaccine?
- What is the likely impact of vaccination on the epidemic trajectory (*a priori*)?
- What was the impact of vaccination on the epidemic (*a posteriori*)?

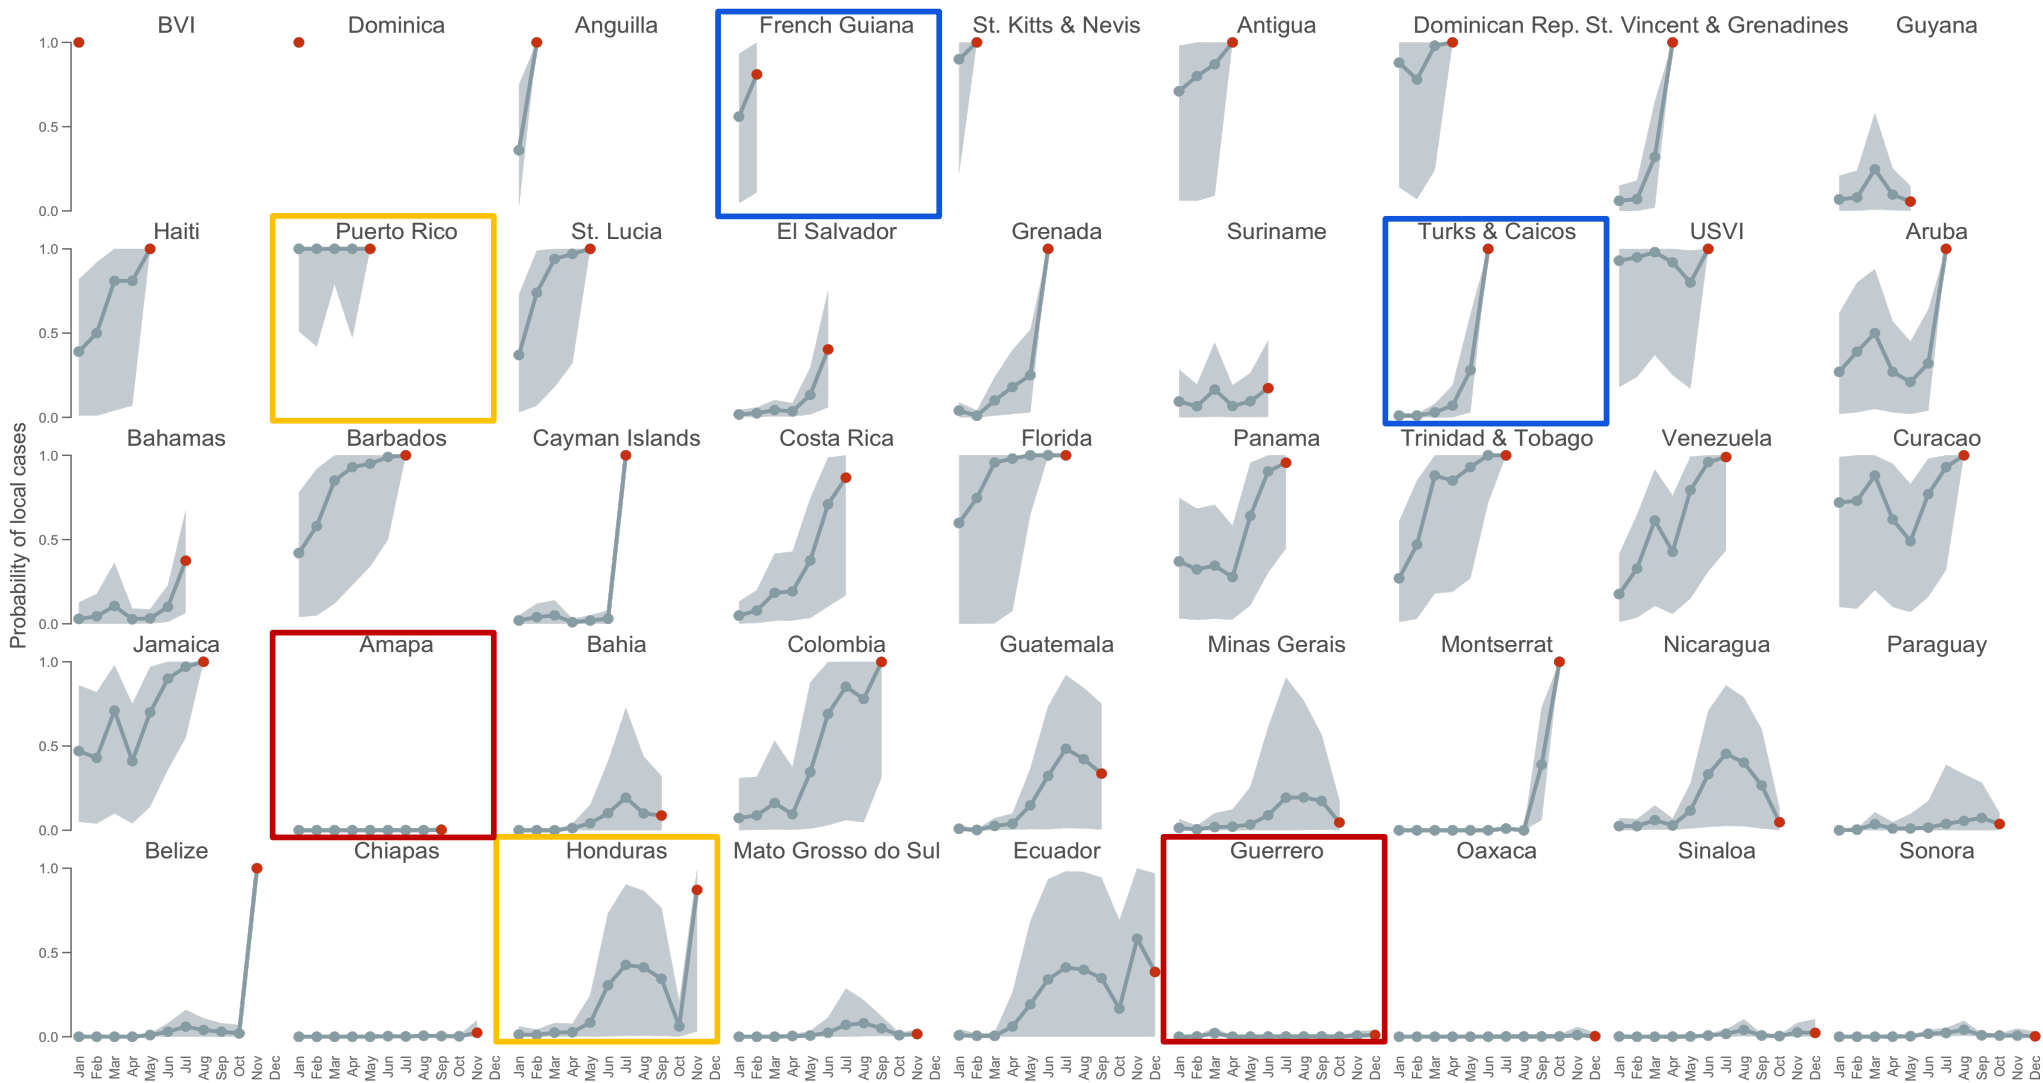

Emerging pathogens

# Risk assessment & intervention planning

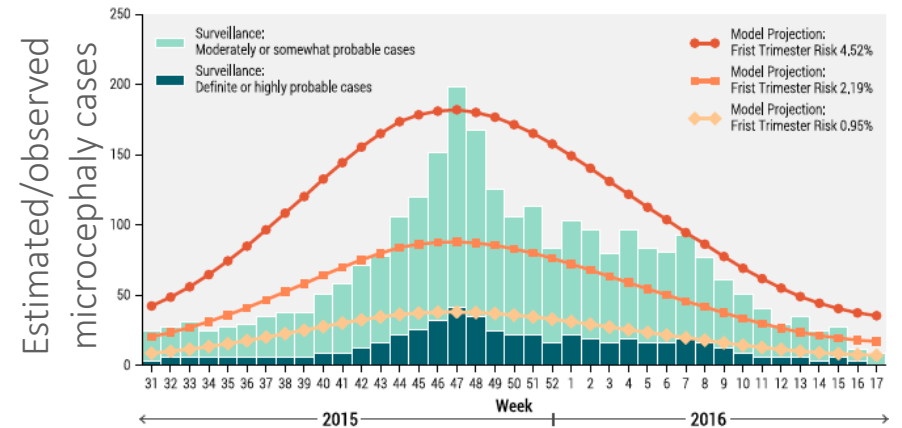

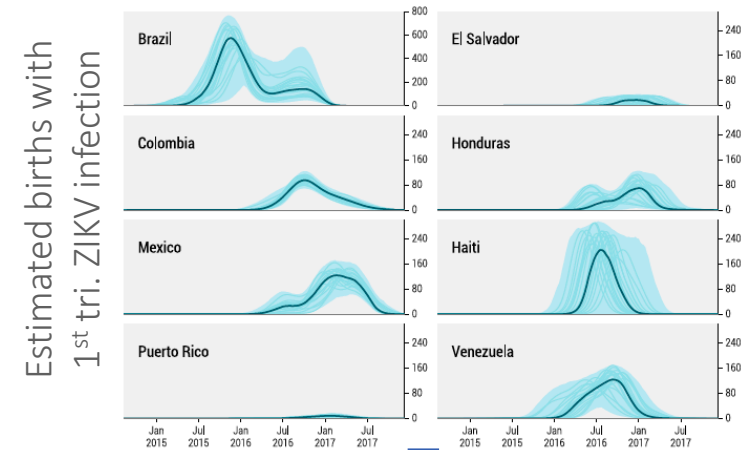

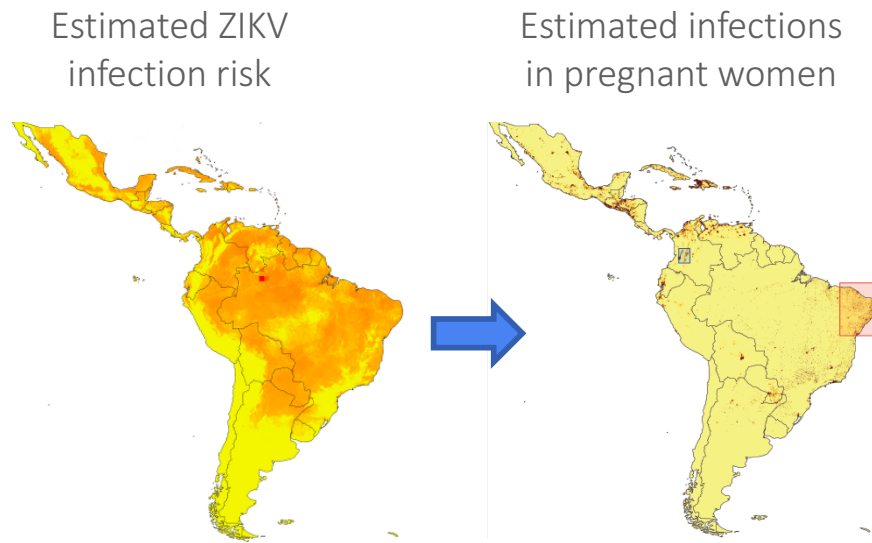

Probability of at least one CHIKV-infected traveler arriving (Dec 2013)

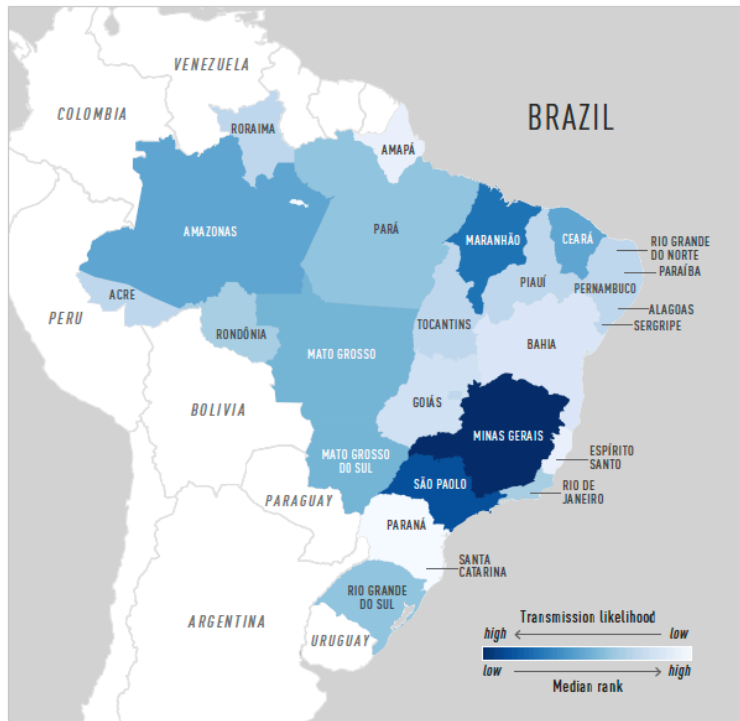

- Where will it go?
- When will it arrive?
- How bad will it be?
- How can it be prevented or controlled?

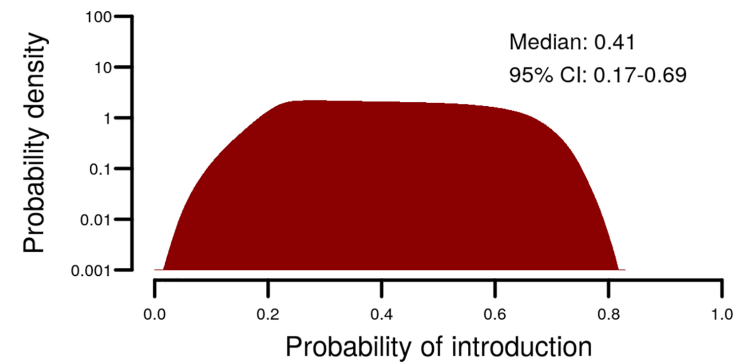

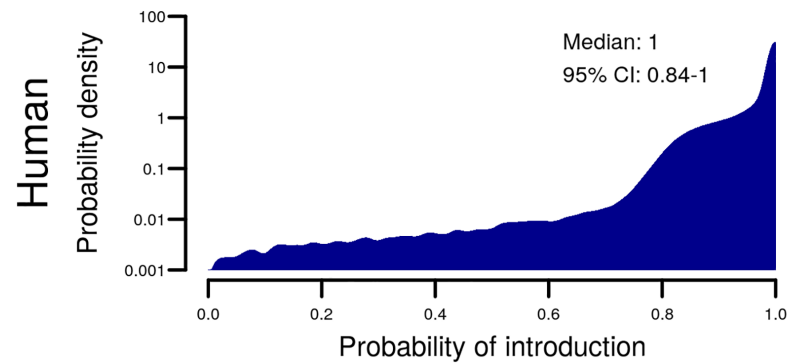

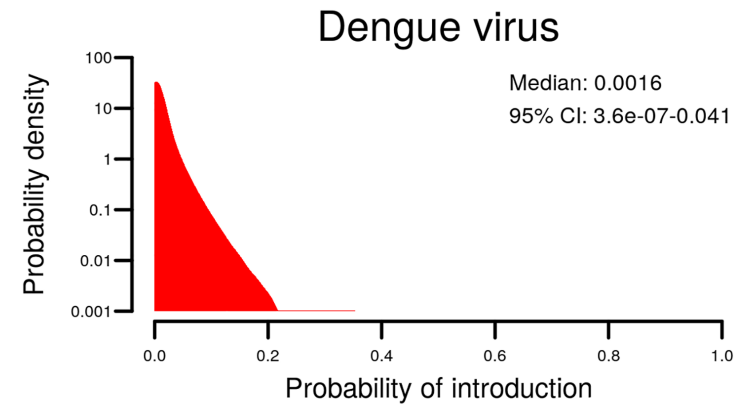

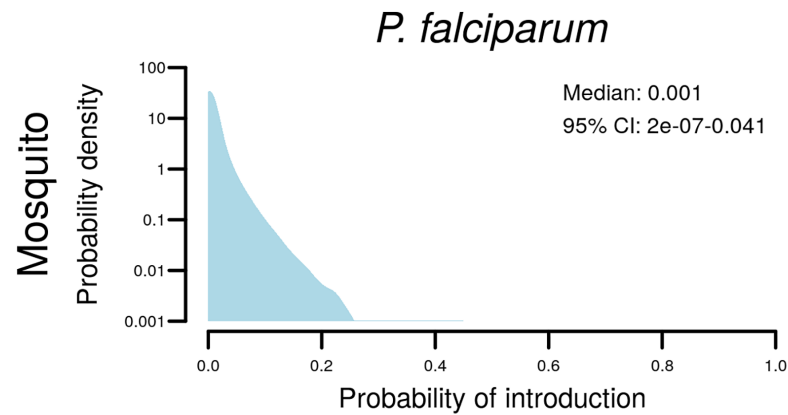

# Impact assessment

# Vaccine development

# Intervention planning (I)

# Intervention planning (II)

# Forecast assessment

- Timing and direction of spread are often predictable with some certainty for many locations.
- Models for estimating epidemic size and severity are improving.
- Models are being used to inform the development and selection of interventions and can be helpful even when the forecast itself is not.

## Importance to vaccination

- What is the likely impact of vaccination (*a priori*)?
- Should a vaccine be prioritized?
- Is there time to develop a vaccine?
- Where and how should vaccine trials be planned?
- What strategy should be used for vaccination?
- What was the impact of vaccination on the epidemic (*a posteriori*)?

Final thoughts

## Forecast of the future?

<b>Disease</b>	<b>Current Activity</b>	<b>3-Month Outlook</b>	<b>Agency Action</b>	<b>Public Action</b>
Dengue	Moderate	Ongoing transmission, epidemic unlikely	Maintain normal surveillance and prevention activities	Use caution and avoid contact with mosquitoes
Influenza	Moderate	Incidence increasing, peak likely in 2 months	Increase vaccine distribution and messaging	Get vaccinated
Pathogen X	High in country A	Possible local introduction	Educate travelers, prepare healthcare facilities, develop vaccine	Take precautions to avoid exposure and transmission if traveling
