# The Dutch Node

ELIXIR's NL node is hosted by the Dutch Techcenter for Life sciences (DTL), a public private partnership that aims to jointly establish a world-class Next Generation Life Sciences cross technology & cross sector capability including a federated data infrastructure.

The ELIXIR NL node acts as the gateway of ELIXIR capabilities and expertise to all the associated partners in DTL. The NL node focuses its contribution to ELIXIR in three core areas: data interoperability, compute & storage infrastructure services and training.

## Data interoperability and exchange

Several Dutch groups have specialized in data capture standards, software, semantic web standards and formats to enable meaningful exchange and integration of biological information. ELIXIR NL will focus on implementing and developing professional capturing, publishing and hosting of data in standard (semantically interoperable) format that will be offered in a public-private partnership in close collaboration with other ELIXIR nodes and the Hub

## Compute and storage infrastructure services

The e-infrastructure capabilities of the Dutch national compute, data and ultra high speed network infrastructure are a clear strength of the ELIXIR NL Node, with extensive experience in running a shared compute and storage environment for collaborative life science projects. The ELIXIR NL node will focus on supporting complex data/compute-intensive life science projects, in collaboration with, and complementary to the offerings of other ELIXIR nodes.

## Training

ELIXIR-NL will contribute extensive experience and capacity in bioinformatics training built up within NBIC, and will leverage broad education & training capabilities of the broader DTL partnership in a comprehensive portfolio in the broader scope of the ELIXIR train programme.

## WHAT IS FAIR DATA?

The FAIR Data Initiative aims at supporting existing communities in their attempts to enable valuable scientific data and knowledge to be published and utilised in a 'FAIR' manner.

**F**indable - (meta)data is uniquely and persistently identifiable. Should have basic machine readable descriptive metadata.

**A**ccessible - identifiers should provide a mechanism for (meta) data access, including authentication, access protocol, license, etc.

**I**nteroperable - (meta)data should be machine readable and annotated with resolvable vocabularies/ontologies.

**R**eusable - (meta)data is sufficiently well-described to allow (semi)automated integration with other compatible data sources.

## FAIR DATA RESOURCE

Datasets expressed using one of the prescribed standards of the FAIR Data Protocol, with metadata complying with the protocol and license. The original dataset is transformed into a FAIR format and proper metadata and license are added to produce a FAIR Data Resource. The original and the FAIR version can co-exist, each one fulfilling its own purpose.

Anomalies in folate and homocysteine metabolism can result in homocysteinemia and are implicated in disorders ranging from vascular disease to neural tube defects. Two enzymes are known to methylate homocysteine, vitamin B(12)-dependent methionine synthase (MTR) and betaine-homocysteine methyltransferase (BHMT). BHMT uses betaine, an intermediate of choline oxidation, as a methyl donor and is expressed primarily in the liver and kidney. We report the discovery of a novel betaine-homocysteine methyltransferase gene in humans and mice. The human BHMT2 gene is predicted to encode a 363-amino-acid protein (40.3 kDa) that shows 73% amino acid identity to BHMT. The BHMT2 transcript in humans is most abundant in adult liver and kidney and is found at reduced levels in the brain, heart, and skeletal muscle. The mouse Bhmt2 gene shows 69% amino acid identity and 79% similarity to the mouse Bhmt gene and 82% amino acid identity and 87% similarity to the human BHMT2 gene. Bhmt2 is expressed in fetal heart, lung, liver, kidney and eye. The discovery of a third gene with putative homocysteine methyltransferase activity is important for understanding the biochemical balance in using methyltetrahydrofolate and betaine as methyl donors as well as the metabolic flux between folate and choline metabolism in health and disease. ## Abstract

We have developed a method that predicts Protein-Protein Interactions (PPIs) based on the similarity of the context in which proteins appear in literature. This method outperforms previously developed PPI prediction algorithms that rely on the conjunction of two protein names in MEDLINE abstracts. We show significant increases in coverage (76% versus 32%) and sensitivity (66% versus 41% at a specificity of 95%) for the prediction of PPIs currently archived in 6 PPI databases. A retrospective analysis shows that PPIs can efficiently be predicted before they enter PPI databases and before their interaction is explicitly described in the literature. The practical value of the method for discovery of novel PPIs is illustrated by the experimental confirmation of the inferred physical interaction between CAPN3 and PARVB, which was based on frequent co-occurrence of both proteins with concepts like Z-disc, dysferlin, and alpha-actinin. The relationships between proteins predicted by our method are broader than PPIs, and include proteins in the same complex or pathway. Dependent on the type of relationships deemed

### New Hope for ALS

Patient stem cells help identify common problem, leading to clinical trials

By JOSEPH CAPUTO  
April 10, 2014

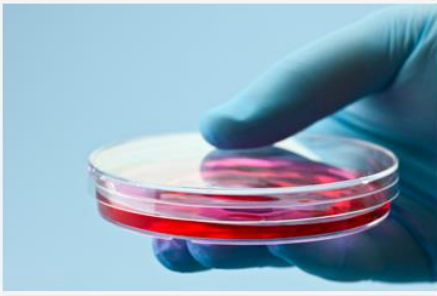

Image: iStock

Harvard stem cell scientists have discovered that a recently approved medication for epilepsy may be a meaningful treatment for amyotrophic lateral sclerosis (ALS)—Lou Gehrig's disease, a uniformly fatal neurodegenerative disorder. The researchers are now collaborating with Massachusetts General Hospital to design an initial clinical trial testing the safety of the treatment in ALS patients.

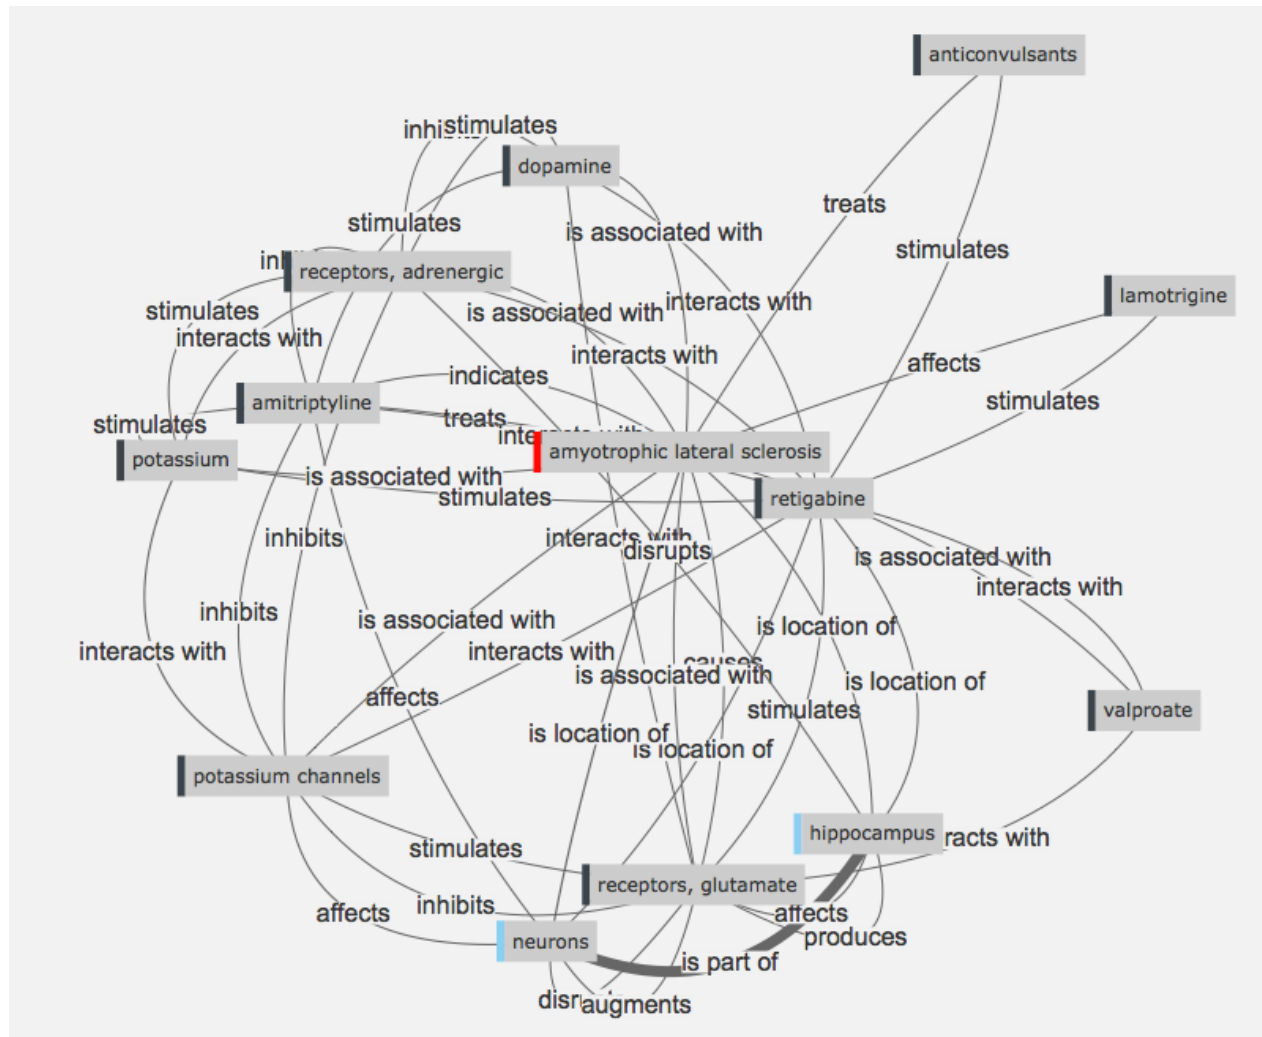

The investigators all caution that a great deal needs to be done to ensure the safety and efficacy of the treatment in ALS patients before physicians should start offering it.

“Also just saw this article on ALS and Retigabine, a drug that affects Potassium channels and might work for ALS. Would BRAIN have predicted this relationship?”

EURETOS

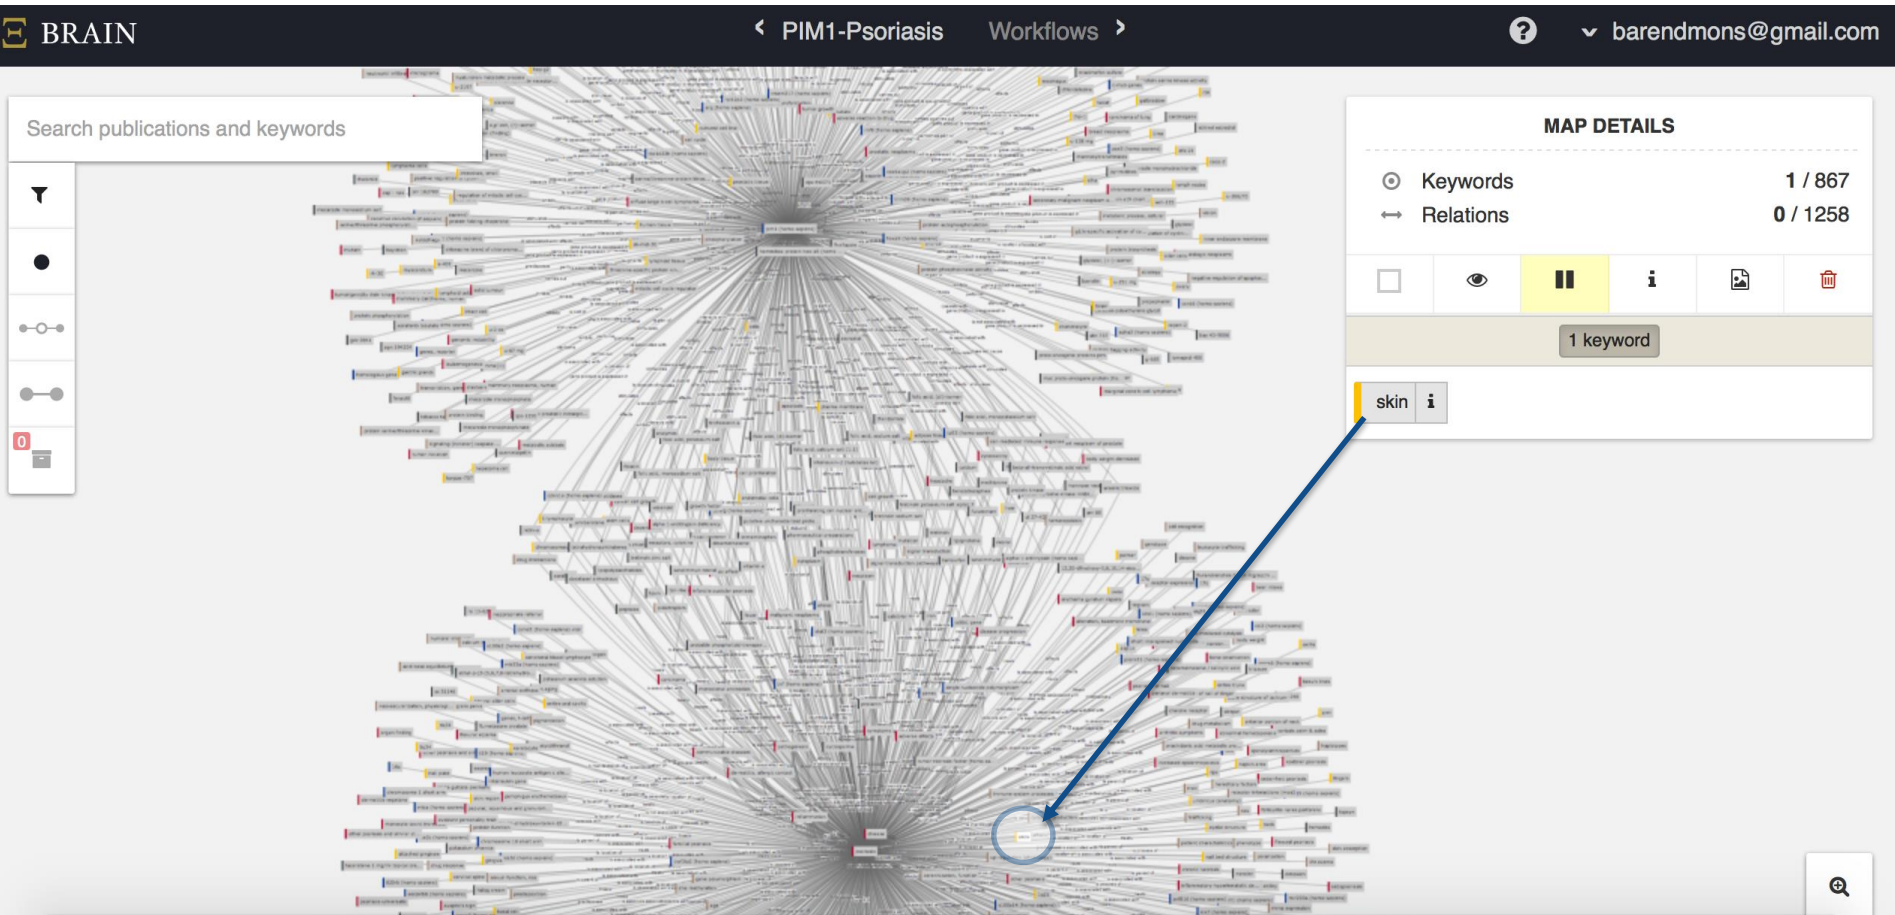

# The power of Self-organising Graph of Cardinal Assertions: BRAIN

Before this paper was published, BRAIN1.0 contained sufficient indirect relationships between **Retigabine** and **ALS** to predict it as a potential drug.

Discovery that several mutations associated with ALS cause abnormally high activity in **motor neurons** > early degradation. There is a deficit in open **potassium channels** in ALS motor neurons. **Retigabine**, a drug that **opens potassium channels** and approved for human use, seems to **normalize ALS cells in vitro**, reducing their hyperexcitability > clinical trials in preparation.

## The Gene Disease Association Study (GDAS) Initiative

One of our key ambitions is to make industrial grade knowledge discovery available to all. We believe knowledge should be shared as early on as and widely as possible. To enable this type of knowledge sharing on genetic diseases we have started a public private initiative, the 'Gene Disease Association Study (GDAS) initiative with the [Leiden University Medical Center \(LUMC\)](#), the [Erasmus Medical Centre Rotterdam \(EMC\)](#) and the [Dutch Techcentre for Life Sciences \(DTL\)](#)

### The **Gene Disease Association Study (GDAS)** Initiative

- Top 1% of most likely potential **gene-disease** associations
- '**Crowd**' validation by experts
- **Hundreds of diseases** planned for 2015

SEED ARTICLE: SUGGESTION FOR FURTHER RESEARCH

## Is **LAMB3** (homo sapiens) biologically associated with **Amyotrophic Lateral Sclerosis** (ALS)?

**GDAS Initiative**<sup>1,2,3,4</sup>

**1** Leiden University Medical Centre (LUMC), **2** Erasmus University Medical Centre (EMC), **3** Dutch Techcentre for Life Sciences (DTL), **4** Euretos.

*The Gene-Disease Association Studies (GDAS) initiative publishes potential biological mechanisms for gene-disease associations resulting from (1) clinical sequencing, (2) transcriptomics, (3) Genome Wide Association Studies or (4) literature analysis where no explanatory mechanism has been published. The associations derived from literature are based on the Indirect Conceptual Association score (ICA score), a measure developed by the LUMC and the EMC<sup>1</sup>. The potential disease mechanisms are provided by Euretos.*

*The most promising gene-disease mechanisms, preferably having multiple types of associations, are published for review by experts to assess their biological meaning. By focusing on mechanisms supported by multiple types of associations, the likelihood that an association may be biologically relevant is significantly increased.*

### ABSTRACT

A combination of ICA score<sup>1</sup> and GWAS<sup>2</sup> associations suggests that an interaction between LAMB3 (homo sapiens) may exist. Further analysis using the BRAIN knowledge discovery platform<sup>3</sup> shows that LAMB3 (homo sapiens) has 22 concepts indirectly associated with Amyotrophic Lateral Sclerosis (ALS) via 8 anatomical locations, 2 disorders, 11 biologically active molecules and 1 gene. These relations are supported by 101 references to publications or databases. Based on this we believe assessment by experts for biological meaning is justified.

The 21 indirect relations that have contributed to the high ICA score

## Prof. David Webb (Scripps Research Institute)

**||** BRAIN is nothing less than an in silico way to save all drug and biotech researchers an infinite amount of blood, sweat and tears by providing them with a very powerful knowledge discovery platform.

BRAIN allows the researcher to rapidly assess whether a given target, research area, etc., is related, even distantly, to another such entity thus allowing one to uncover hidden connections, leading to new knowledge. In the drug discovery arena, this thing is a **gold mine**

**||**
