# Inducing HIV-1 neutralizing antibodies by stabilized native-like SOSIP envelope trimers

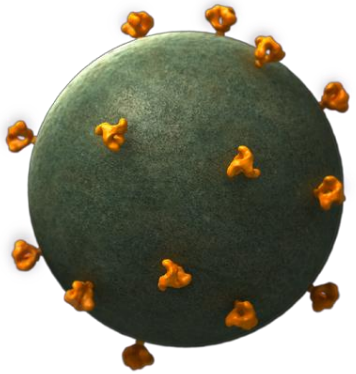
Rogier Sanders

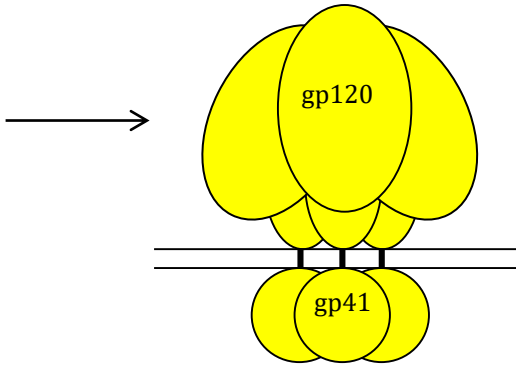
Amsterdam University Medical Centers, Location AMC, University of Amsterdam, Netherlands
Weill Medical College of Cornell University, New York, U.S.A.

100 Gardes meeting, Veyrier-du-Lac, France, October 1st, 2019

# Hypothesis:

## A stable structural and antigenic mimic of the native, cleaved envelope trimer should induce neutralizing antibodies





Native Env spike

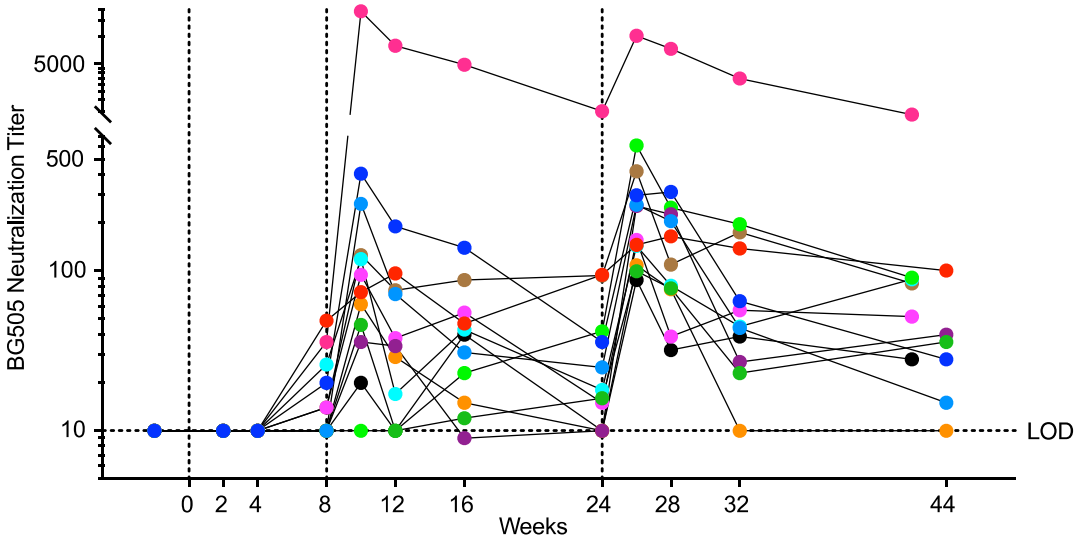
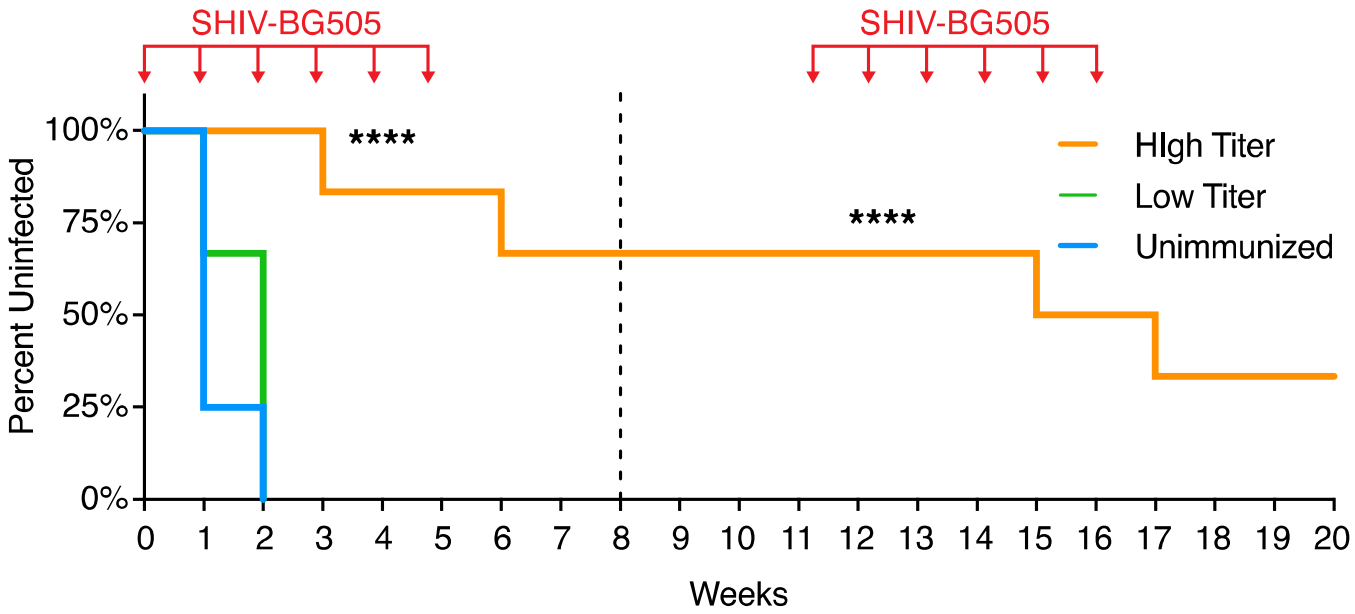
# The BG505 SOSIP trimer induces NAb-mediated protection in rhesus macaques against the homologous Tier 2 SHIV virus





Pauthner *et al.* 2017. *Immunity* **46**:1073-1088

Pauthner *et al.* 2019. *Immunity* **50**:1-12

# Evaluating NAb induction by BG505 SOSIP trimers in humans

**Clinical trial 1 (IAVI W001): dose-ranging in AS01b (PI: J.McElrath)**

**Clinical trial 2 (HVTN137): adjuvant screening (PI: J. McElrath)**

**Immunogen: BG505 SOSIP.664**

**Vaccinations (months)**

**Goals:**

- Establish that the trimer is safe and well tolerated.
- Determine whether the trimer induces autologous NAbs (also heterologous NAbs, and undesirable Abs)
- Compare human Ab responses to the SOSIP trimer with responses in other animal models (e.g., NHP, rabbits, guinea pigs, rats)

# "The SOSIP design is flawed because SOSIP proteins are in State 2"

**From Lu M, ...., Sodroski JG, Mothes W. 2019. *Nature* 568:415-419**
**"BG505 sgp140 SOSIP.664 proteins are in a conformation that is distinct from the native Env"**, specifically conformational "State 2" and not the more appropriate "State 1".

**From Castillo-Menendez LR, Nguyen HT, Sodroski J. 2019. *J. Virol.* 93: pii: e01709-18**
**"[There are] differences in conformation between structurally well-characterized HIV-1 Env trimers (sgp140 SOSIP.664 and EnvΔCT complexed with the PGT151 antibody) and native, mature Envs on primary HIV-1."**

**From Nguyen HT, Alsahafi N, Finzi A, Sodroski JG. 2019. *J. Virol.* 93:pii: e00304-19**
**"The I559P and SOS changes have a profound impact on the conformation of Env, moving Env away from the native pretriggered Env conformation".**

# "The SOSIP design is flawed because SOSIP proteins are in State 2"

**From a grant review:**

"**A major concern is the proposed use of SOSIP trimers as immunogens.** The Sanders' lab (co-applicant) and others describe these soluble gp140s as being "native-like" trimers. …. How well SOSIPs really capture the "native-like" structure of Envs incorporated into infectious viral particles is unclear. ….. data presented at Cold Spring Harbor Retroviruses and the Institute of Human Virology meetings showing that **SOSIPs are stabilized in a conformation that differs from the native-like State 1 conformation**. Therefore, how good is an immunogen that does not recapitulate the structural properties of a real Env (functional incorporated Env) can be?"

**From a manuscript review:**

"This is another very clear example of how the Moore group continues to demonstrate repeatedly how to NOT elicit cross-reactive neutralizing antibodies to HIV-1…. This group of investigators … most likely fail to elicit efficiently cross-neutralizing HIV-1 antibodies because of subtle, but **critical, structural flaws inherent in the SOSIP design [as] recently and convincingly shown to result in a default State 2 conformation, rather than the State 1 that is the bonafide native state on the surface of the virus** by the Mothes group (Nature 2019)."

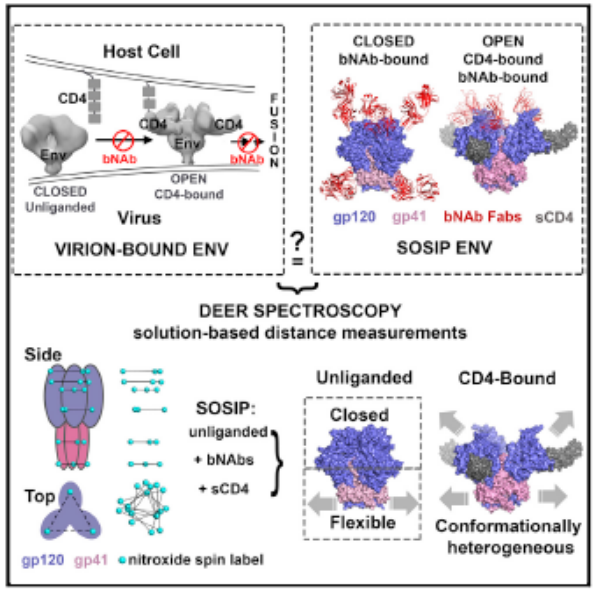
## DEER Spectroscopy Measurements Reveal Multiple Conformations of HIV-1 SOSIP Envelopes that Show Similarities with Envelopes on Native Virions

### Graphical Abstract



### Authors

Beth M. Stadtmueller, Michael D. Bridges, Kim-Marie Dam, Michael T. Lerch, Kathryn E. Huey-Tubman, Wayne L. Hubbell, Pamela J. Bjorkman

### Correspondence

bjorkman@caltech.edu

### In Brief

HIV-1 Env, the only target of neutralizing antibodies, is highly dynamic, and only snapshots of static conformations are available. Stadtmueller et al. used DEER spectroscopy to map conformations of soluble Env and its complexes with antibodies or the CD4 receptor. Results reveal similarities to virion-bound Env and buried non-neutralizing antibody epitopes, advancing knowledge of Env function and vaccine design.

### Highlights

- SOSIP Env apex is 3-fold symmetric and consistent with closed prefusion structures
- Unliganded Env base and CD4-bound Env apex and base exhibit flexibility
- SOSIPs retain desired properties of immunogens; e.g., burying non-neutralizing epitopes
- Results allow interpretation of smFRET studies and SOSIP and virion Env structures

# “The SOSIP design is flawed because SOSIP proteins are in State 2”

“Results suggest similarities between SOSIPs and virion-bound Envs”

“Our experiments showed no evidence of multiple states with respect to V1V2–V4 separation distances”

“[Our data] suggest that BG505 SOSIP exists in a single, symmetric conformation with respect to distances between the V1V2 and V4 regions”

# Why is the interpretation of smFRET data in disagreement with DEER spectroscopy and cryo-EM structures?

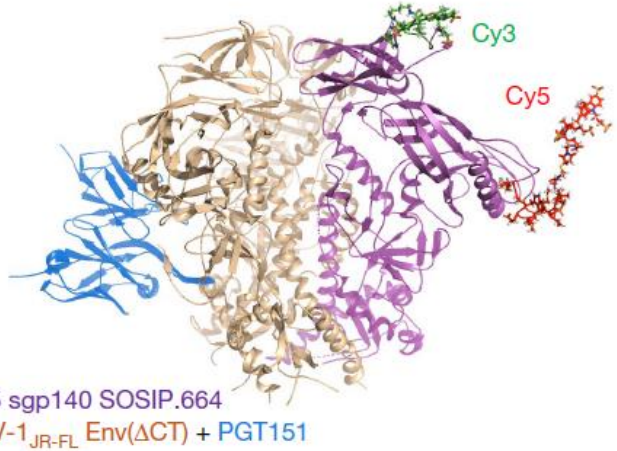
**smFRET signal derives from functional Env AND non-functional Env**

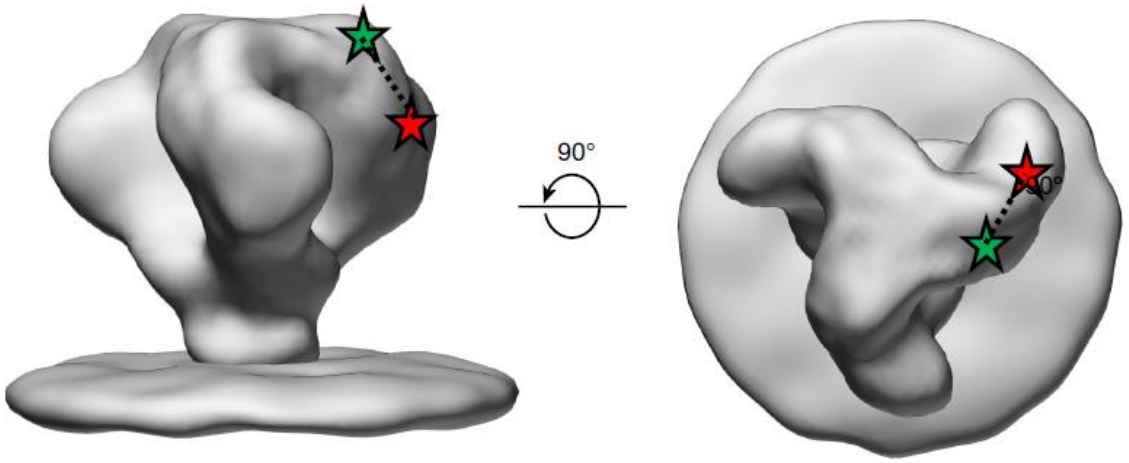
**smFRET uses large flexible labels**

Pamela Bjorkman:
"discrepancy could result from the size, hydrophobicity, and/or flexibility differences in DEER and smFRET labels"
(Stadtmueller *et al.* 2018. *Immunity* **43**:235-246)

Steve Harrison:
"depending on the orientation of the tether through which the acceptor fluorophore is attached, its distance can vary over 30-40 A, enough to span the difference between high and low FRET configurations"
(Pan *et al.* 2019. *JMB,* in revision
bioRxiv, http://dx.doi.org/10.1101/730333)

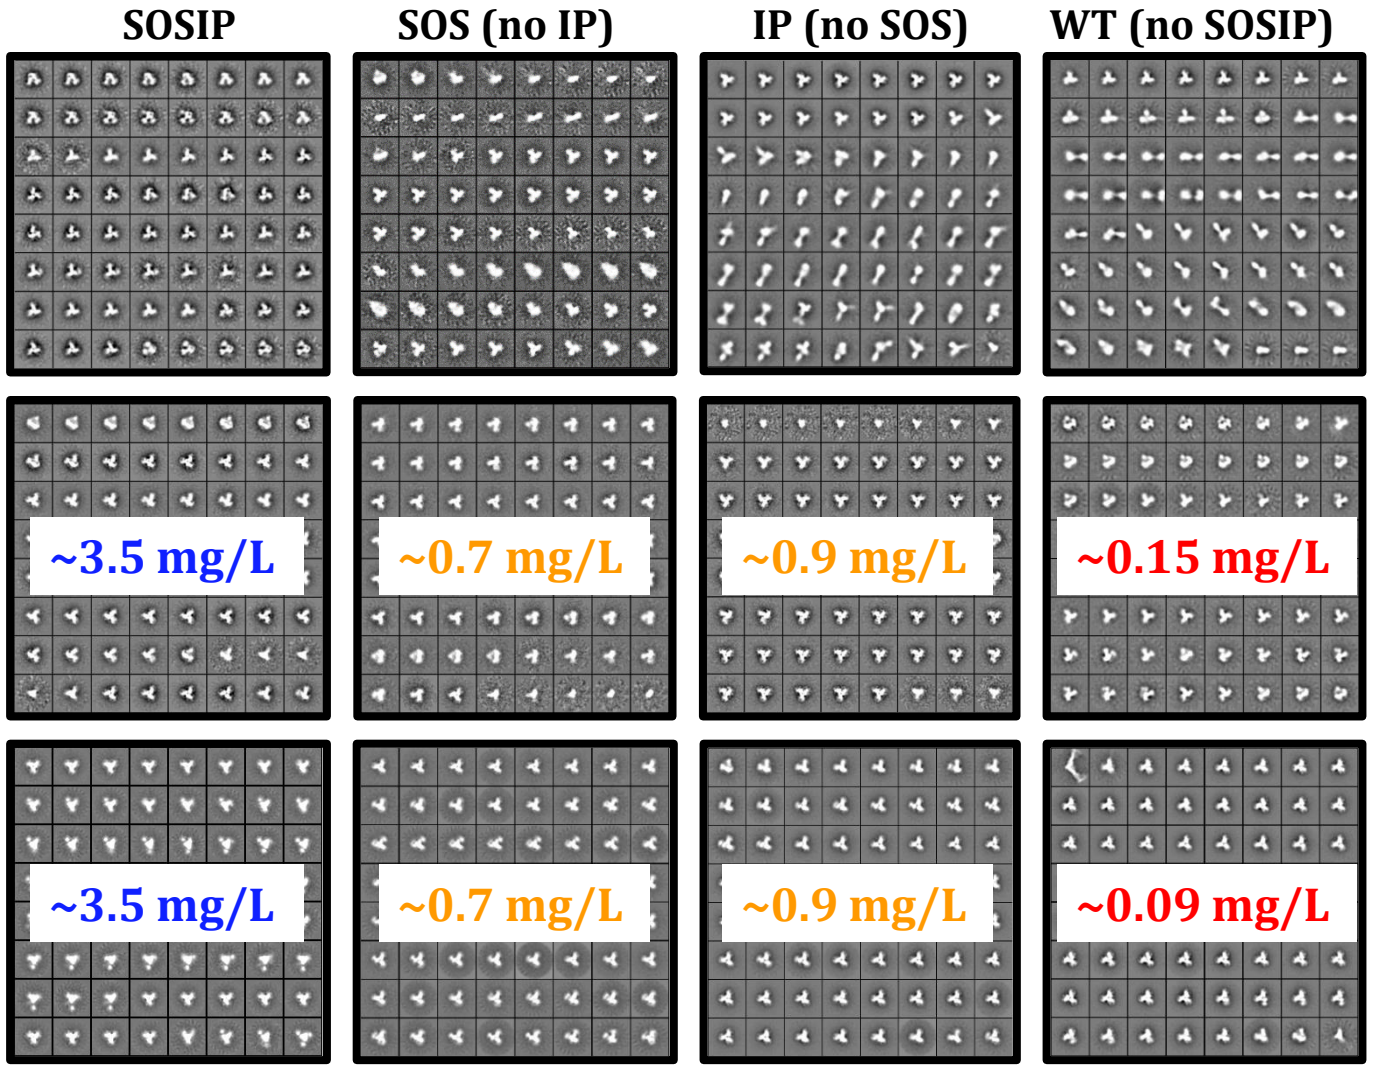
smFRET measures movement of fluorescent labels attached to V1 and V4





Munro *et al.* 2014. *Science* **346**: 759-763
Lu *et al.* 2019. *Nature* **568**:415-419

# The SOSIP mutations do not alter the overall conformation of native-like gp140 but improve the proportion and yield of native-like trimers



BG505 SOSIP.664 variants were made that lacked the SOS and/or I559P changes and expressed in ExpiCHO cells. Trimers were then purified via 2G12/SEC columns, or a PGT151 column, or a PGT145 column.

For each construct, the PGT151- and PGT145-purified trimers had comparable NS-EM appearance, melting temperatures (DSC) and antigenicity for bNAbs and non-NAbs (SPR; not shown).

However, trimer yields were substantially lower when the stabilizing changes were omitted.

Ringe, Moore *et al.* 2019. *submitted*

## Conclusions (part I)

## The structures of full length native Env and SOSIP gp140 are very similar

Native Env trimers purified by “State-1” preferring bNAbs or “State-2” preferring bNAbs are very similar structurally

The conformations of SOSIP trimers purified by “State-1” preferring bNAbs or “State-2” preferring bNAbs are very similar

**One should be cautious with using Env smFRET data to make inferences about Env structure**

The SOSIP mutations do not affect the overall conformation of native-like Env gp140 trimers, only their yields

The SOSIP trimer represent an appropriate mimic of the native Env trimer and therefore a suitable platform for immunogen design, including germline-targeting

# BG505 SOSIP based germline-targeting immunogens

**Preclinical observations *in vitro***

- BG505 SOSIP.v4.1-GT1 (GT1) engages multiple bNAb germline precursors in vitro
- GT1 activates B cells expressing bNAb germline precursors as their BCR
- GT1 crystal structure allowed refinement of the trimer: GT1.1 and GT1.2
- GT1.1 engages 7 in a million naïve human B cells, mostly CD4bs-specific

**Preclinical observations *in vivo***

- GT1, GT1.1 and GT1.2 activate multiple bNAb germline precursors in multiple knock-in mouse models
- GT1.1 primes CD4bs-specific responses in macaques

Proof-of-concept that priming, ‘shaping’ and ‘polishing’ of VRC01-class germline precursors by SOSIP-based immunogens can lead to accommodation of the N276 glycan and heterologous neutralization

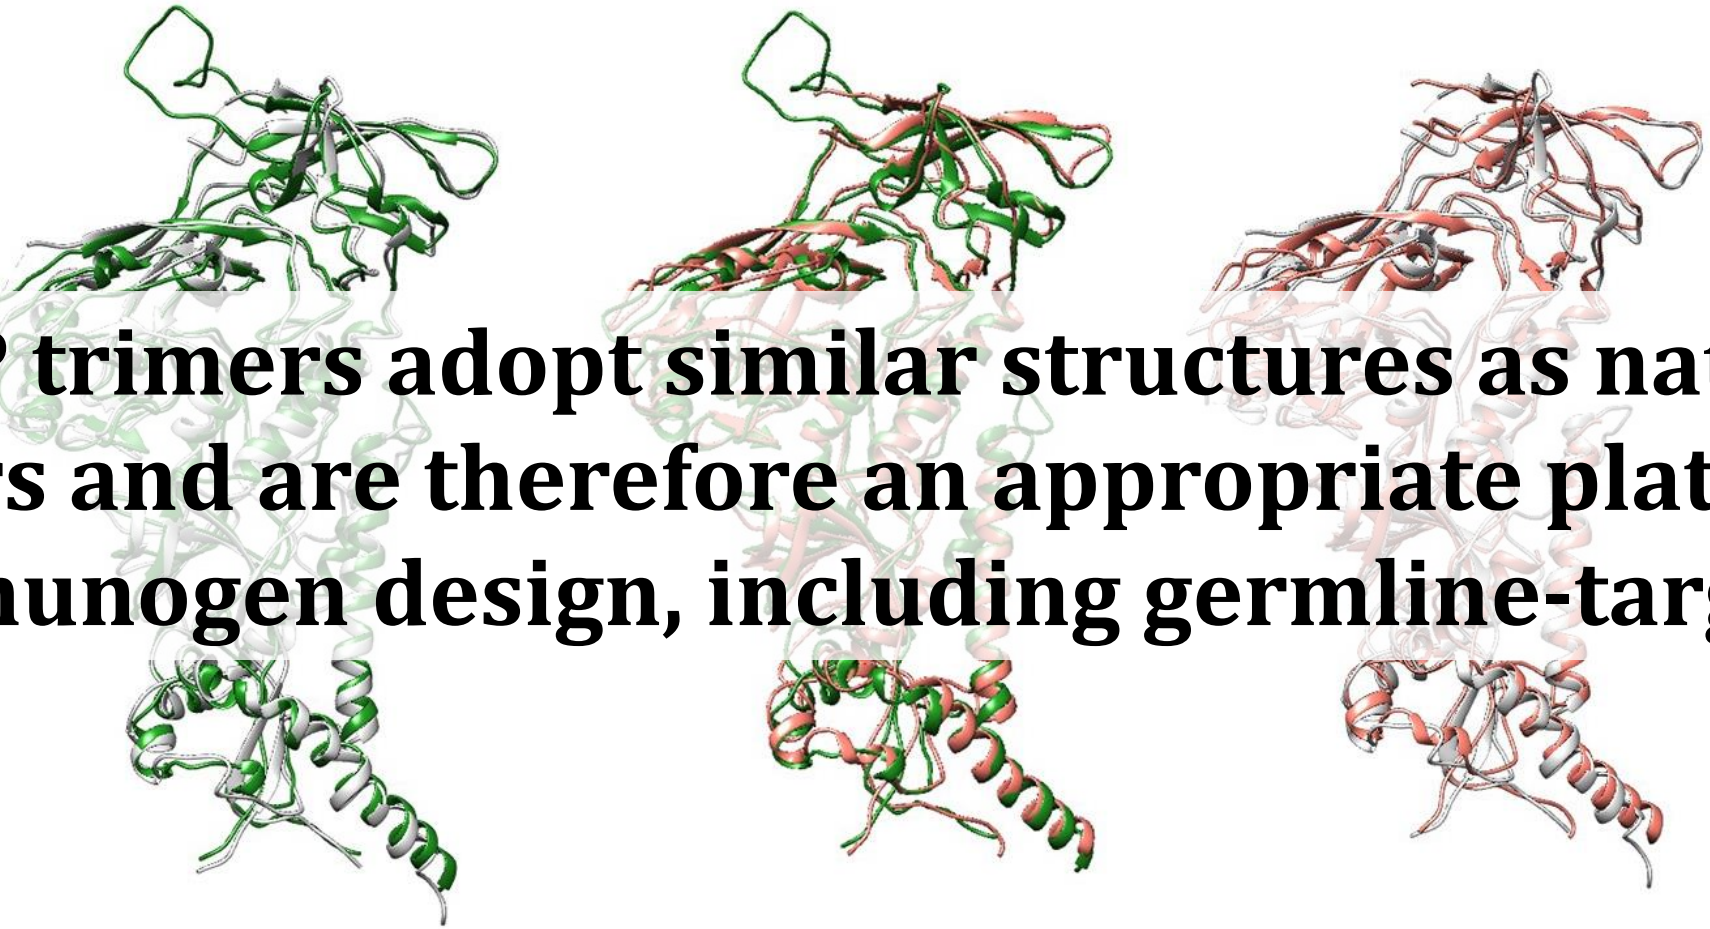
## Conclusions (part II)

SOSIP gp140 can serve as a platform for germline targeting, ‘shaping’ and ‘polishing’

SOSIP-based germline targeting, ‘shaping’ and ‘polishing’ in VRC01-class knock-in mice leads to:

- The accumulation of VRC01-class mutations
- The selection of VRC01-class insertions and deletions
- The establishment of contacts with the neighboring protomer (?)
- The development of Abs that can accommodate the N276 glycan
- The development of Abs that can neutralize heterologous wild-type viruses



# SOSIP trimers adopt similar structures as native Env trimers and are therefore an appropriate platform for immunogen design, including germline-targeting
