

History, vaccine misinformation, and the power of narratives

Elisabeth Wilhelm
Senior SBC Technical Advisor
COVID-19 Team Child Health and Immunization
Bureau of Global Health
USAID

October 21, 2023

Vaccine Acceptance Meeting Series

These views do not necessarily reflect the views of USAID.

A narrative consists of an account of connected events or experiences, often retold as stories.

We make sense of the world through retelling and digesting stories.

Stories that make up narratives can be accurate or not.

How we act on narratives can affect our health.

What do narratives and stories have to do with vaccines and misinformation?

While the causes underlying vaccine hesitancy are complex, the influence of narratives is notably salient as antivaccine advocates frequently rely on personal testimonies to argue that vaccines are neither safe nor effective. Research finds that these adverse narratives have a disproportionate impact on vaccine attitudes and behaviors even when paired with accurate scientific risk information, and this biasing effect of narrative information is stubbornly difficult to counter.

DEATH THE VACCINATOR.

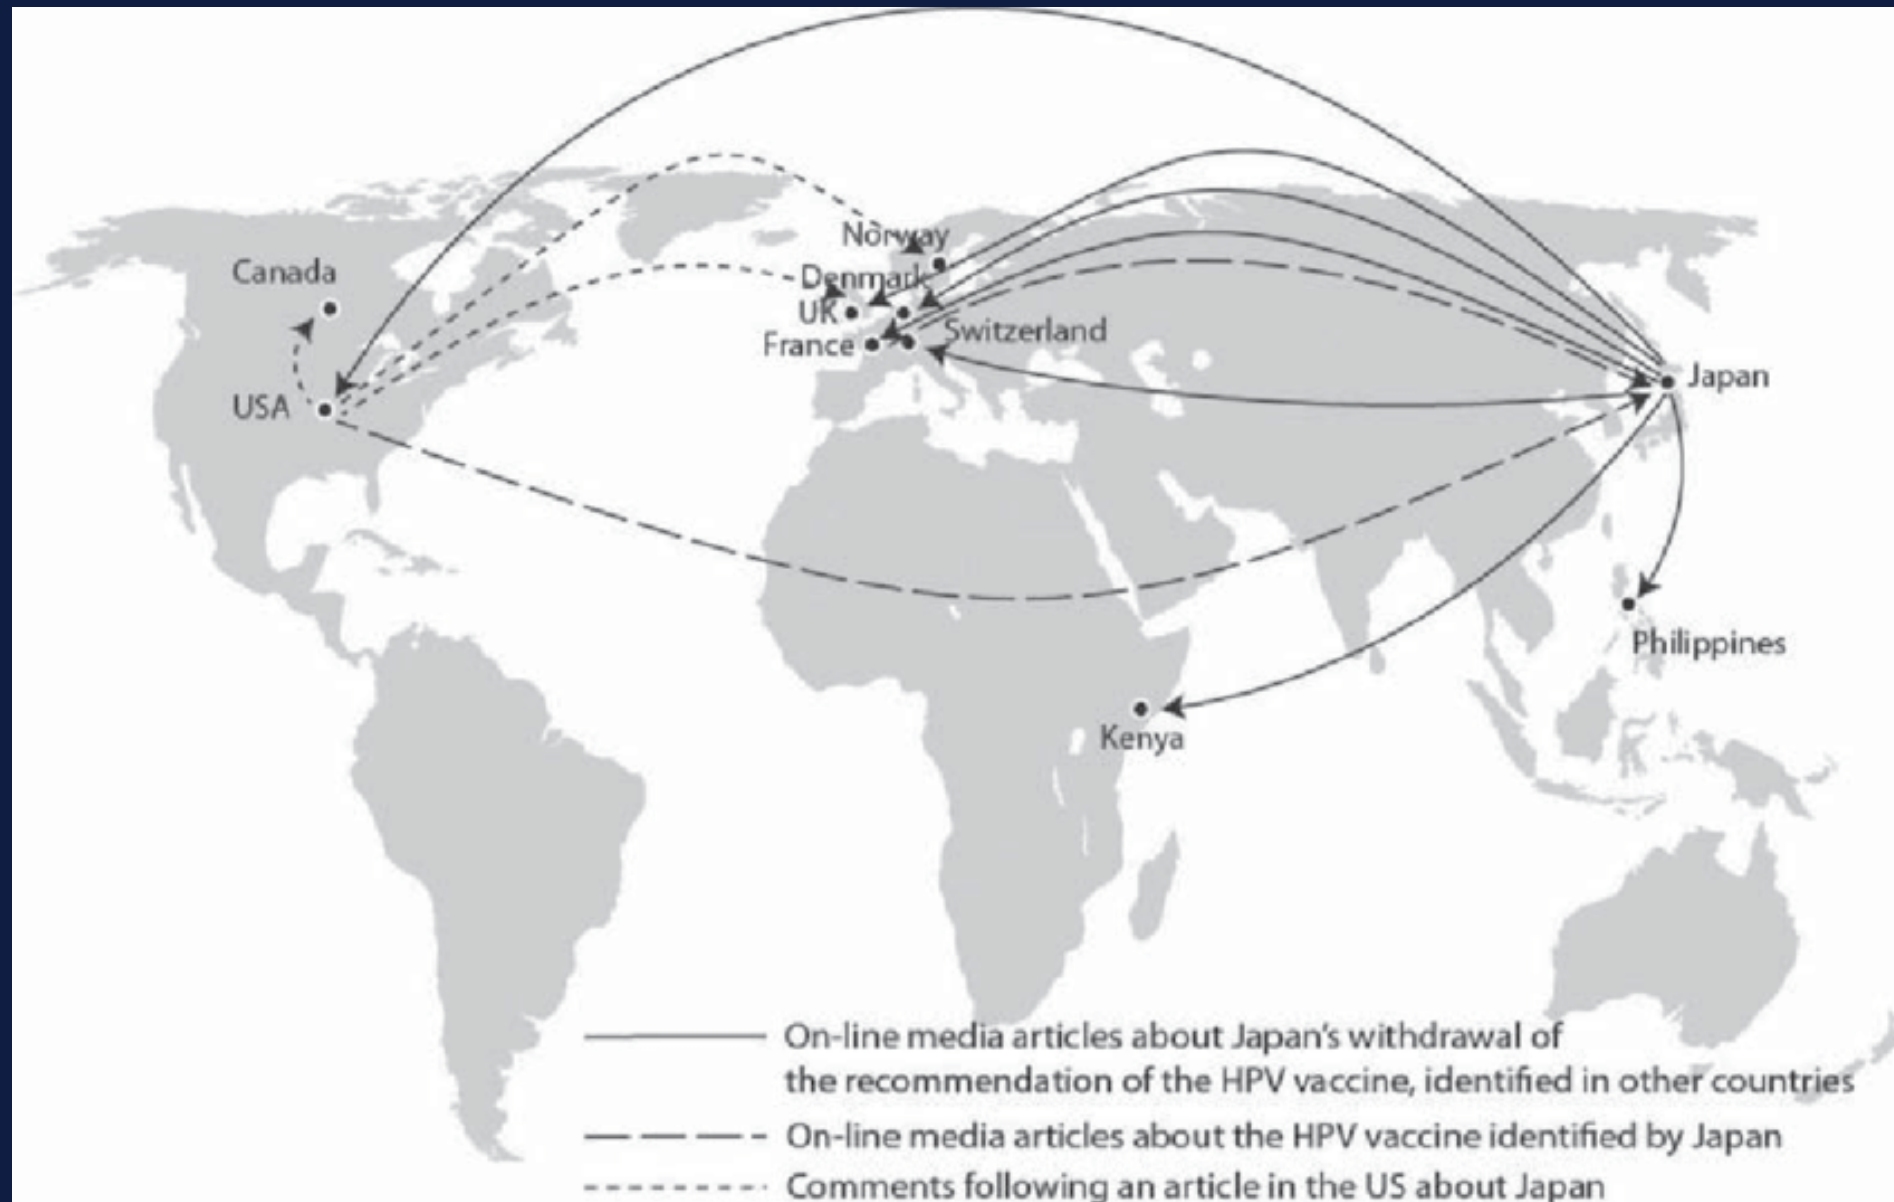

<https://historyofvaccines.org/blog/death-the-vaccinator>

Vaccine misinformation isn't new.

Negative narratives impacting vaccine uptake are also not new.

These continue to harm confidence in vaccines, the vaccinators, and the health system they come from.

<https://www.science.org/content/article/dengue-vaccine-fiasco-leads-criminal-charges-researcher-philippines>

Why is addressing our current information environment so difficult in public health?

Diminished public trust in officials, coupled with increasing diversity of online platforms, creates a context vulnerable to the spread of misinformation.

Debunking misinformation will have limited effectiveness unless the larger social and cultural forces that bolster misinformation are addressed, which requires evidence-based approaches that leverage socio-behavioral and epidemiological insights.

Over the past 15 years, narratives that influence knowledge, attitudes, perceptions, and behaviors related to public health emergencies have circulated faster in our increasingly digitized society. To keep pace, health authorities must be quicker to identify and respond to circulating narratives.

Common vaccine narratives

Development, provision
and access to vaccines

Safety, efficacy and
necessity of vaccines

Political and
economic motives

Morality and

best predictor of vaccine uptake

Common Vaccine Narratives & Misinformation

- Purity of vaccines / vaccine ingredients
- Vaccine side effects
- Vaccine safety
- Doubts about vaccine efficacy
- Conspiracy theories
- Vaccine manufacture, testing and approval
- Alternative treatments and cures

What are some of the elements needed for a narrative to “go viral?”

Pushes emotional buttons and appeals to audience values

Contains images or video specifically formatted for a particular audience and channel

Tells a story

Uses humor or satire

Provides a simple explanation for a complex problem

Uses language that is appealing to the audience (e.g. slang, memes)

Narratives are amplified through networks, both online and offline.

They also self-reinforce one another as they are repeated and mutate with new variations.

Misinformation,
alongside unaddressed
questions and concerns
and information voids,
can snowball into
narratives that can
cause harm.

Narratives that go unaddressed
can also fuel mistrust.

“Mistrust is the outgrowth of the
perception that promises were
broken and values were violated.”

--Dr. Barbara Reynolds

“Zombie” vaccine misinformation perpetuates harmful narratives that...

- Vaccines aren’t safe.
- That diseases stem from “over there.”
- Vaccines can damage your future.

They keep coming back because they are emotionally resonant and seem easy to believe, often because they are shared by people you trust.

Zika Virus Found In Recent Shipment Of Bananas; CDC Is Warning Of Safety Concerns

Understanding gist: What is the real, underlying meaning of a narrative?

Understanding gist can also help you identify underlying meanings and values that may be propelling a narrative.

Example Narrative
what is said

Vaccines aren't safe.

That diseases stem from “over there.”

Vaccines can damage your future.

Example Gist
what is heard

The government and health system don't have our best interests at heart.

The diseases come from less developed places but it doesn't really affect us.

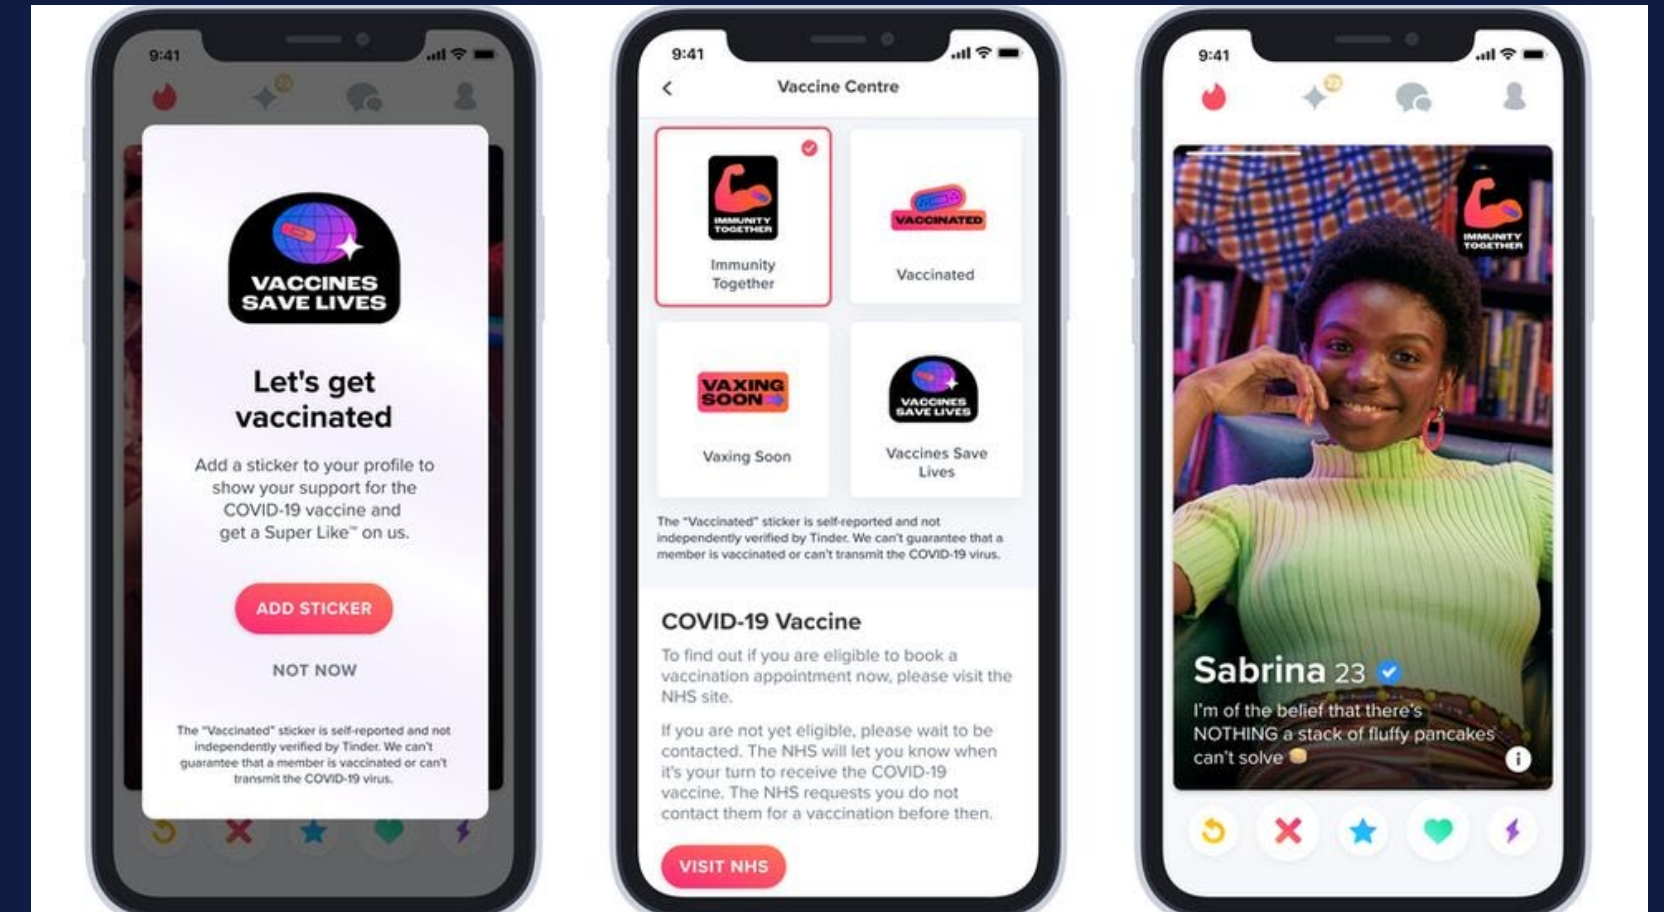

Someone is gaining a short term benefit at the risk of our future health.

Inequity and health system and government actions also can sharpen mistrust and make it more difficult to address people's health information needs.

Social norms and cues, especially in online spaces, are also a part of narratives that can affect vaccine confidence.

Positive examples

COVID vaccine hesitancy leads to child health concerns in PNG

<https://www.aljazeera.com/news/2022/12/30/covid-vaccine-hesitancy-leads-to-child-health-concerns-in-png>

Addressing larger narratives that can harm vaccine confidence defy easy solutions. They can't be solved with communications alone.

'Got polio?' messaging underscores a vaccine campaign's success but creates false sense of security as memories of the disease fade in US

<https://theconversation.com/got-polio-messaging-underscores-a-vaccine-campaigns-success-but-creates-false-sense-of-security-as-memories-of-the-disease-fade-in-us-190518>

COVID-19 boosters: If everyone is at risk, no one is at risk

[https://www.thelancet.com/journals/lanmic/article/PIIS2666-5247\(23\)00299-9/fulltext](https://www.thelancet.com/journals/lanmic/article/PIIS2666-5247(23)00299-9/fulltext)

How to address these narratives?

Debunking narratives is extremely difficult to do because often, they contain an element of truth and because they are already widespread.

It's better to prevent harmful health narratives from taking root in the first place.

Source: Tuckerman, J., Kaufman, J., & Danchin, M. (2022). Effective approaches to combat vaccine hesitancy. *The Pediatric Infectious Disease Journal*, 41(5), e243.

How to more effectively address
future anti-vaccine narratives

Remember, this will take time.
Displacing dominant narratives
is very difficult.

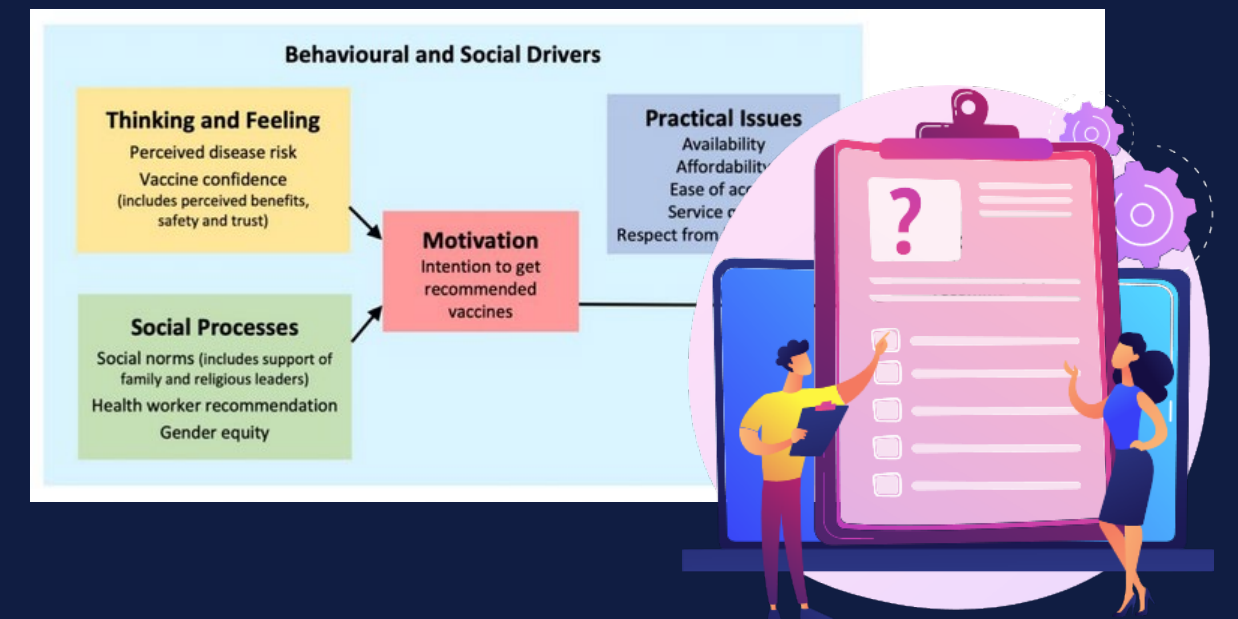

1. Understand the information environment.

Conduct social listening and infodemic management activities and develop insights reports

<https://iris.who.int/handle/10665/370317>

Routinize sociobehavioral data collection and analysis to understand changes in perception and behavior

<https://demandhub.org/behavioral-and-social-drivers-of-vaccination-besd/>

2. Consider values and gist when developing more effective messages.

Leverage participatory and novel evaluation methods to understand narratives and how they move through communities (e.g. social network analysis, social media narrative analysis, Most Significant Change, PhotoVoice).

<https://www.betterevaluation.org/methods-approaches/approaches>

Test messages and materials more rapidly and consistently via digital pretesting and A/B testing.

<https://www.vitalstrategies.org/resources/using-a-b-testing-for-campaigns-on-digital-media/>

3. Utilize relationship-based outreach strategies.

Develop peer-to-peer approaches to sharing vaccine information and addressing vaccine misinformation which includes balancing personal experience, storytelling and fact-based content.

<https://www.ncbi.nlm.nih.gov/books/NBK572168/>

Adapt approaches such as Motivational Interviewing to online contexts to reach online observers.

<https://www.sciencedirect.com/science/article/pii/S0747563222004290>

4. Keep your promises and publicize them.

Share program successes and actionable “news you can use” for different stakeholders in different formats (e.g. livestreams, social media tiles, infographics).

Create community feedback loops for stakeholders to improve health service delivery and programming.

5. Invest in and strengthen digital communication with the public.

Develop pro-vaccine, pro-social narratives that work for each priority population and develop segmented approaches for reaching them.

Capacity build and appropriately resource health promotion and communications functions to improve quality and quantity of social media content and more channels through which people can seek information.

Additional Slides

Narratives do not need to rely on words
alone to spread.

Today's information environment has
provided new challenges.

What about
debunking?

Narrative, norming and digital techniques are used to evade content moderation and boost anti-vaccine content

Disguise Tactics

- Pronouns
- Written text
- Hand gestures
- Synonyms
- Anagrams
- “Leetspeak”
- “Just asking questions”
- Contradictory or ironic titles
- Upload of past content
- Live streams
- Disguised channels

Replication Tactics

- Content mirroring
- Backup channels

Dispersion Tactics

- Collaboration
- Alternative services

What can affect someone's exposure and ability to act on health information, especially online?

Access to the internet can be expensive, which may shape user behavior

Digital literacy skills affect how well someone can navigate and understand digital information

Form of internet access, whether on smartphone or computer

Algorithms affect what information we see; we are likely to see content and connections that we agree with

Social norms affecting who should access social media and why (gender)

Language used to browse internet and use social media

But harmful narratives are common in other areas of health too

Health topic areas that are represented in health misinformation research
